

autovictor

 Keep on moving to the future.

*Heavy Machinery
Movement*

Autovictor offers complete services for the handling, lifting and installation of industrial machinery, production lines and special equipment. The vehicles available to Autovictor allow it to operate in confined spaces and active production environments, using compact cranes, self-propelled trailers and lifting systems that guarantee precision and safety at every stage.

Heavy Machinery Movement

The assembly and maintenance of industrial systems represent a critical phase in many sectors. These activities require precision, safety and speed of execution, and frequently involve large components and heavy machinery, often to be installed or replaced in confined environments or at heights.

In this scenario, cranes, mobile cranes, forklifts, telescopic handlers and aerial platforms represent the indispensable tools for the movement and positioning of machinery and components; lifting and assembly at height; ordinary and extraordinary maintenance (when required); in general, internal handling linked to industrial logistics. Before each intervention, Autovictor draws up a preliminary analysis and operational planning with its specialized operators, including a technical inspection to evaluate the weights, dimensions and dimensions of the components to be moved but above all to analyze the structural constraints, accesses, floors and aerial obstacles in notoriously restricted and delimited areas such as industrial plants. Planning is often supported by 3D simulations performed “in-house” by Autovictor engineering. Once the optimal type of equipment to be used and their configuration in terms of capacity, outreach, working height, etc. have been established, then comes the operational phase. Typical uses are the assembly or replacement of presses, turbines, boilers, compressors, silos, tanks, the installation of metal carpentry and piping with operations often at heights on complex structures and within delimited and restricted areas.
